

WordPress Installation Guide

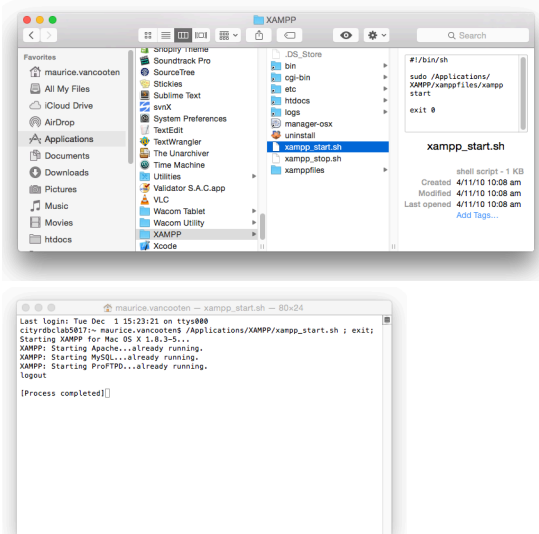

Dependencies

This guide assumes you have XAMPP preinstalled.

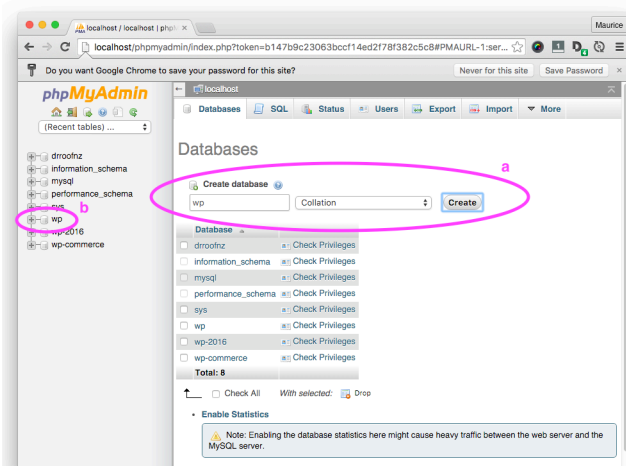

Installation

Creating an empty MySQL database.

1. Starting XAMPP. On the Yoobee Mac navigate to; Applications > XAMMP, and double click on; xampp_start.sh script. A Terminal window will pop up indicating that XAMPP has started. Leave this Terminal window open.

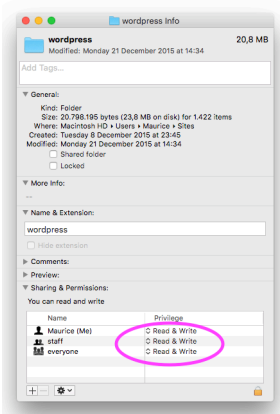

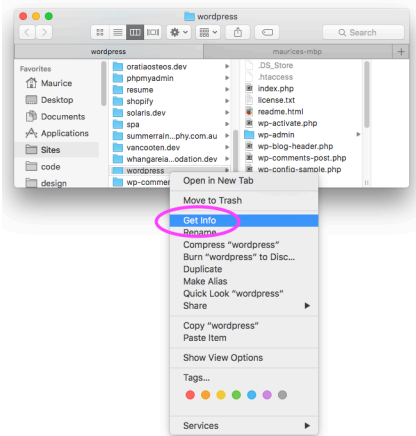

2. Navigate to PHPMyAdmin in the browser: <http://localhost/phpmyadmin>.
3. When prompted for a login fill in your username and password:
username: root
password: (blank)
4. In the top menu select; Databases.
5. In the field beneath; Create database, type a name for your database e.g. 'wp', and select; Create.

6. In the left column you see that your 'wp' database has been created.

Installing WordPress on localhost.

1. Download WordPress; <http://wordpress.org/download>.
2. Extract the files from the zipped folder.
3. Move the directory 'wordpress' into the 'htdocs' directory.
4. Change permissions to; Read & Write, on the 'wordpress' directory.

5. In the browser access the folder you've just placed in 'htdocs' through this url; <http://localhost/wordpress>.*
6. You're prompted with a message that states; there's no configuration file. Select; Create a Configuration File.
7. Have your database information ready, select; Let's go!.
8. Fill out the WordPress configuration details for your database, then select; Submit.
mysql database: wp
mysql login: root
mysql password: (blank)
mysql server: localhost
table prefix: wp
9. Fill out website credentials, remember or securely file your username and password.
10. Select; Log in.
11. Log in with your WordPress username and password.
